S

Dear Sir,

I am glad the rats  
are of some interest - When sending  
them I thought they were larger  
than the sketch you showed me,  
but as they agreed so well in  
other respects I concluded that  
they belonged to the same species,  
and that the difference in size  
was attributable to the luxuriance  
of the feed about here. I hope  
to get you some males, and  
a female Notomyscus before  
long, but I am afraid the  
young of the latter are now  
fairly

Many thanks for Basson's  
book which you so kindly  
sent me. At present I am  
suffering from bad eyes, so  
that have not been able to  
domineer than dips into it but  
I can see that there is a great  
deal -

I will send something by next  
mail if possible, and if not  
when rain falls!

With kind regards

I am faithfully  
Yours faithfully  
P. M. Dymo

P. M. Dymo

Yours -

Have been trying to get information  
from the natives that might shed  
some light on the reason for  
the slowness of the waterfalls,  
but without result. Can't it  
possibly that some lizard ancestor  
of theirs affected a causal appendage  
like a platypus, and that this  
peculiarity has survived in a  
modified form?

The waters here are nearly dry,  
and all the stock have been  
shipped to the finds so that  
there is even less life than  
usual about. I don't know  
what we will do if no rain  
falls before March, as the  
stocks are existing on dust  
and recollection now.
