

(L498)

WHATCOMBE,
BLANDFORD.

June 15. 1884

My dear General Pitt Rivers

Mr. Fisher's Paper

on the Dorset Depositions
will be read on Wednesday
at the Geological, Burs
Lecture House. As it
will be the last meeting
of the year I fear there
will be little time for
discussion unless a
few innocents are
introduced to make
room. Last week I
found a volume which
appears to approach
a ~~frasted~~ one than any

Other 2 meridionalis
I have met with in
the bed. This I shall
bring up with me as
well as the typical
form & a number of
S antigens. If there
is a discrepancy - & men
who must wish to take
part in it with respect
to the relative age of the
bed as by relation with
specimens of the Elephanta
it will be well
interesting. I now feel
sure the bed is
Pliocene. In order
the evidence ~~the~~ it

is capped with a covering
of soft brown stiff clay
dipping from the ordinary
clay of the neighbourhood
I hope you will be able
to attend. The series of
and see the series of
I send. Write please as
of which the deposit is
composed. I remain

Yours truly
H. Murray. Murray

I am off for an expedition
to Encombe early tomorrow
so I am writing to night

POST CARD

THE ADDRESS ONLY TO BE WRITTEN ON THIS SIDE.

J. C. Meunier - Pley dell, Esq.

Best thanks for the
pattern, which has just
come in time for a fig-
ure I was having done. I
believe that we shall have
to do away with P. oxoni-
ensis, since the cervical ap-
pear to belong to your
form, while the three speci-
mens are P. philarchus. I
have now no reasonable doubt
that your specimen is P. hex-
agonus. - I cannot tell
whether your paper will be
read, but I hear there are
a good many. R. L.
10/5/88.
